Adaptability

According to the Dictionary of Library and Information Science, adaptability is defined as the "ability to change or be changed so that a library and information system can respond to the needs and wishes of the user community." It is the capacity of the library and information system (LIS) to meet the changing needs of its users. Adaptability is not a static characteristic; rather, it is a dynamic quality that evolves over time. It is a multifaceted concept that encompasses a wide range of factors, including technological advances, changes in user needs, and organizational restructuring. In order to maintain adaptability, LIS must continuously assess and respond to the needs of its users. This requires a commitment to innovation, flexibility, and a willingness to take calculated risks. The ability of LIS to adapt to changing circumstances is essential for its long-term success and relevance.
